HealthCORR

Paul Rosenfeld, Ginnah Lee, Awalin Sopan, Angela Noh, Sohit Karol,

12.09.2009

CMSC734
Acknowledgements

- Todd Park, our sponsor who is willing to clear time in his busy schedule for some grad students
- Patrick Conway, for compiling the CHSI data set
- Karen Milgate, for compiling the comprehensive Medicare data set
- Ben Shneiderman, for his continued guidance and support

And also a lot of anonymous open source-loving nerds who have contributed their time and energy into building tools so we don't have to!
Motivation

- Health care is among the **most important** issues facing the United States in the near future
  - It is not always clear to those in charge what the problem is or even that a problem exists
  - Example: McAllen, TX has the worst health care record in the country (highest costs, lowest quality) and the mayor of McAllen did not know until he read about it in *The New Yorker*

"Knowledge will forever govern ignorance, and a people who mean to be their own Governors must arm themselves with the power knowledge gives." -- James Madison, 1822
Data

Community Health Status Indicators
Various indicators about risk factors and general health quality

Center for Medicare & Medicaid Services
Detailed Medicare spending/quality data

County level data
HRR level data

Quality
Access
Public Health
Cost
Goals

- Target audience: "people in charge" -- hospital administrators, mayors, local government representatives, etc.
  - People with some knowledge, but not "experts"

“Someone without a PhD in health economics should be able to use this tool” - Todd Park
Goals

- Those using the tool should be able to consider how an area of interest is doing along the four main axes.

**Comparison**

Easy to compare a region (county or HRR) to state average, national average.

**Filtering**

Filter out "excuse factors" (such as average age, median income, poverty levels, etc.) that aren't necessarily health indicators.
Why a Web App?

Ease of access
Interoperable with any operating system, processor, network you are on. Nothing to download, nothing to configure, no compile errors.

Ease of updates
Tool (and data) can evolve over time without having to push new versions.

Ease of Open Source tools
We are leveraging some industrial grade open source technologies (more on this in a second).
System Architecture

Client
- Browser
- Google Closure (UI widgets)
- Javascript (glue code)
- Open Layers (map/interactions)

Server
- Apache http server
- php
- pChart (graphs)
- PostGIS (spatial database)
- Apache Tomcat
- GeoServer (map rendering)

Connections:
- AJAX
- HTTP
- WMS
Main Features

- Initially start searching an area of interest by zip code

Map view
- Draw the map
- Zoom in & out to see the overview and detail
- Allow to choose health indicators to want to see

For both map and table
- Can apply dynamic filter with defining the ranges by double sided sliders

Table view
- See different types of data by tabs
- Sort by columns to find correlated variables and areas

Graph view
- Compare all selected variables with national averages of each
Demo
Future works

- Discover similar areas as benchmark
- Add more types of graphs
- Add more excuse factors for filter
